

# Are you managing your weight loss goals?

# MedShape Weight Loss Clinics

*Introduces the*

# BodyComp 5000

## Shape your body to the next level

## What this revolutionary machine **can do for you:**

## Understand Your **Body Composition**

Calculate both lean and body fat mass to help you understand your current ratio and monitor your progress in each as you progress through the MedShape program.

## Analyze Your Water Balance

The majority of body water is intracellular water and found in muscles and organs. This analysis will reveal your body water ratios and help you better understand if you're deficient in these areas that can impede productive weight loss.

## Conduct an **Obesity Analysis**

Understanding and monitoring your BMI (Body Mass Index) and PBF (Percentage of Body Fat) helps you understand the degree of fitness your body currently resides in. Monitoring this will give you a true indication of the success of your weight loss program.

## Segmental Lean Analysis

Do you understand how your muscle mass is distributed throughout your body? This bonus analysis helps you understand possible disproportionate muscle distribution which will help you and your doctor determine a corrective course of action for better muscle alignment.
